E-Learning Data Analysis – Summary Report

This project analyzes an e-learning dataset to understand learner behavior, course performance, and revenue trends. The dataset includes information about learners, courses, and purchase transactions.

Key Insights:

The analysis shows that a small number of courses contribute to a large portion of total sales. These top-performing courses have the highest purchase quantities, indicating strong demand among learners. Additionally, certain course categories generate significantly higher revenue compared to others.

Learner spending varies across countries, with some regions contributing more to overall revenue. This suggests geographical differences in purchasing behavior. It was also observed that many learners purchase courses from multiple categories, indicating diverse learning interests.

However, a few courses have not been purchased at all, highlighting potential issues such as lack of visibility, low demand, or ineffective marketing.

Recommendations:

Focus marketing efforts on high-performing course categories to maximize revenue. Promoting these popular courses through targeted campaigns can further increase sales.

For underperforming or unsold courses, consider improving course content, updating pricing strategies, or increasing promotional activities to boost visibility.

Additionally, analyze customer behavior by region and tailor marketing strategies accordingly. Encouraging cross-category learning through bundle offers or discounts may also increase overall engagement and sales.

Conclusion:

The analysis provides valuable insights into course performance and learner behavior. By leveraging these insights, the platform can improve decision-making, enhance customer engagement, and increase revenue.
